DecisionScience Plus

Brief Description:

For use in making multicriteria decisions DecisionScience Plus uses a proven methodology that brings logic and reason to bear on a seemingly insolvable situation. This product ranks and identifies inconsistencies, which supplies the user with a completely defensible solution. The "Feature Comparison of Decision Products" provides a list of features, compared to other decision making products.

How the Product Works:

DecisionScience Plus breaks a complex situation down into its' smallest possible components. These components are then evaluated with input from the user on a "one on one" basis. After the evaluation is complete, DecisionScience Plus automatically recombines the input via state of the art mathematics to produce a precise and consistent decision. The user may then analyze the decision both for how various factors affected the decision and how they contributed to the inconsistency. "What if" analysis is supported by convenient editing features and a unique error analysis procedure guides the user in reducing the inconsistency in the decision. Three reporting options are available to explain the decision in the level of detail desired by the user.

Our Competition:

There are no other decision making products in the Windows v3.0 (tm) environment. (Windows v3.0) is a trademark of Microsoft.)

Availability:

The DecisionScience Plus Windows v3.0 application will be released 2nd quarter 1991. The DecisionScience Plus Macintosh application will be released 3rd quarter 1991.
